SUMMARY

Software Engineer focused on Python web development, APIs, and data-centric applications. Experienced building systems that ingest, transform, and visualize operational data using Django, Flask, and external APIs. Built dashboards and reporting tools that convert raw datasets into actionable insights for operational decision-making.

EXPERIENCE

NDX Green Dental

Heber Springs, AR

Dental Lab Technician / Software Developer (Part-Time)

May 2015 – Present

- Built an internal dashboard [[Preview on GitHub](#)] to track remake trends and production quality across 200k+ lab records.
- Created reporting views used in management meetings to break down remake rates by doctor, department, and lab over 3, 6, and 12-month periods.
- Added logic to highlight recurring high-remake patterns so management could quickly identify problem areas.
- Improved data import workflow by switching from full reloads to rolling 12-month updates to reduce processing time and avoid unnecessary reprocessing.
- Built search-based filtering so users could pull doctor-level metrics without relying on fixed navigation or hardcoded reports.

PROJECTS

MetaNexus — Real-Time Deck Builder Platform (Live Preview) | [[GitHub](#)]

Jan 2026 – Feb 2026

Django, Python, JavaScript, Redis, WebSockets

- Built a real-time deck builder with WebSockets for live updates and Redis for message handling.
- Imported and processed 30,000+ card records from the Scryfall API with rate limiting and batching.
- Added client-side filtering for fast search without page reloads.

SkyPulse — ISS & Weather Tracking Dashboard (Live Preview) | [[GitHub](#)]

Oct 2025 – Nov 2025

Python, Flask, SQLite

- Built a Python ETL pipeline to collect ISS telemetry data every 10 minutes using external APIs.
- Created a Flask dashboard combining live ISS position data with weather API data.
- Added retry and fallback logic to handle API timeouts and external service failures.

Retention & Remake Analytics System - Prototype (Live Preview) | [[GitHub](#)]

March 2026

Python, Django, SQLite, Google Gemini API, Chart.js

- Built a Django dashboard to analyze remake patterns across doctors and departments using structured lab QA ticket data.
- Designed aggregation logic using Django ORM to compute remake frequency and surface high-risk doctors based on activity patterns.
- Integrated Google Gemini API to generate short, context-aware retention suggestions based on recurring remake causes.

TECHNICAL SKILLS

Languages: Python, JavaScript, SQL (PostgreSQL, SQLite), HTML5, CSS3

Frameworks: Django, Flask, FastAPI, Streamlit, Node.js

Tools & Cloud: Power BI, AWS, Git, Docker, Linux, Postman, Pandas, REST APIs, Redis, WebSockets

EDUCATION

Western Governors University

Salt Lake City, Utah

Bachelor of Science in Software Engineering

Jan 2025 – Aug 2025

- Completed the full degree program in 8 months by learning new material quickly and demonstrating competency through assessments.

CERTIFICATIONS

AWS Cloud Practitioner • CompTIA Project+ • ITIL 4 Foundation
